Becoming a Top 0.0001% Student with LockIn

A practical plan for using the LockIn study app, built on two study systems: the "top 0.001% grades" system and the "learn fast with AI" method.

No app can guarantee a top 0.0001% result. That comes from doing the right things for months, and the app's job is to make them hard to skip. Both videos describe the same thing: spend your hours on high-yield material, test yourself instead of re-reading, fix your mistakes systematically, and never let AI do your thinking.

Week 1: Set it up once

1. **Exam Strategist:** paste 20 or more past questions per exam. Check the skip list yourself before trusting it. This decides where all your hours go.
2. **Subject Hub:** add your notes and log any marked papers you already have.
3. **Flashcards:** generate cards for the top-priority topics, so the daily reviews start from day one.

Every day (about 1.5 to 3 hours, plus cards on autopilot)

Follow the **Daily Mission** on the dashboard, in this order:

1. **Flashcards (10 to 20 min):** every day, no exceptions, even on bad days. At least one session daily matters more than a big session occasionally.
2. **Retry mistakes (10 to 15 min):** on the Mistakes page, redo your wrong questions without looking at the answers.
3. **One deep topic from your priority list (30 to 60 min):** use the Teach-Back Lab.
    - Start at Level 1 and go deeper only when you're ready.
    - Write your one-line version and your comparison before you check anything.
    - Argue with the AI wherever something feels off.
    - Run the verify step on anything specific.
4. **Log your study time.** The streak and heatmap only work if you're honest.

When something doesn't click, use **Explain Simply**, but type your own guess first and build the concept map yourself. The effort of making the links is what makes it stick.

Every weekend

- **One full timed past paper** under exam conditions. Log every question where you lost marks, with the real reason: didn't know it, didn't recognise the question, or silly mistake.
- **Sunday Check-in:** read the numbers honestly and write down what you will change.
- **Weekly Exam:** it is built from your own mistakes, so treat it like the real thing.

What to watch in Insights

- **Your mistake causes.** Lots of silly mistakes means slow down and add a checking pass. Lots of "didn't recognise" means do more varied papers. Lots of "didn't know" means more cards and Teach-Back.
- **Your past-paper trend.** If it isn't rising over 3 to 4 weeks, change something.
- **Your streak and card accuracy.** Consistency over months is what separates people at this level.

Rules that keep it working

- **Think first, AI second.** If you are only reading AI's answers, you are not learning.
- **Don't trust a confident answer.** Verify specific facts against real sources.
- **Don't skip topics out of laziness.** Skip only what the exam data supports.
- **Don't skip the retries.** Fixing known weaknesses is the cheapest score gain there is.
- **Protect your sleep and take breaks.** An exhausted streak helps nobody.

Honest limits

The app can't see how good the rest of your country is, so it can't tell you a percentile. Its numbers measure your own trend, not your rank. Real papers and real marking are the only honest benchmark. If you are serious about the very top, also get real past papers from your exam board, and have a teacher mark your written answers sometimes, because AI grading can be generous.

Next step

Write down your exam, your subjects, and how many weeks you have left, then build a first-week plan from the steps above.
